

### **anion recognition in supramolecular pdf**

A fundamental understanding of anion binding by receptors is essential for managing salts during energy, water, and food production. However, the limited understanding of solvent effects in ion recognition leads to a persistent blind spot that prevents effective receptor design.

### **Anion Binding in Solution: Beyond the Electrostatic Regime**

Evidence for pi stacking. The benzene dimer is the prototypical system for the study of pi stacking, and is experimentally bound by  $8 \pm 12$  kJ/mol ( $2 \pm 3$  kcal/mol) in the gas phase with a separation of 4.96 Å... between the centers of mass for the T-shaped dimer. The small binding energy makes the benzene dimer difficult to study experimentally, and the dimer itself is only stable at low ...

Going for gold: The mono- and di-chloroform solvates of  $[\text{Au}_2(\text{1,2-bis(diphenylarsino)ethane})_2](\text{AsF}_6)_2$  undergo single-crystal-to-single-crystal transformations that result in gain or loss of only one chloroform molecule and changes in the structure and luminescence of the digold cation.

### **Chemistry – A European Journal: Early View**

Seeing old friends in a new light: A divergent synthesis of quinine and quinidine (see structures) was designed on the basis of a symmetrical and nonstereogenic intermediate, conceptually different from the stereodefined piperidine precursors used in past syntheses. Complementary late-stage local-desymmetrization reactions were developed to access the two targets.

Endotoxins liberated by gram-negative bacteria are frequent contaminations of protein solutions derived from bioprocesses. Because of their high toxicity in vivo and in vitro, their removal is essential for a safe parenteral administration.

1. Basic concepts1.1.. Categories of nanostructured materialsOne of the very basic results of the physics and chemistry of solids is the insight that most properties of solids depend on the microstructure, i.e. the chemical composition, the arrangement of the atoms (the atomic structure) and the size of a solid in one, two or three dimensions.

## Nanostructured materials: basic concepts and microstructure

Cell-free Production of the Extracellular Domain of the Nicotinic Acetylcholine Receptor

Enzyme catalysis is the increase in the rate of a chemical reaction by the active site of a protein. The protein catalyst may be part of a multi-subunit complex, and/or may transiently or permanently associate with a Cofactor (e.g. adenosine triphosphate). Catalysis of biochemical reactions in the cell is vital due to the very low reaction rates of the uncatalysed reactions at room temperature ...
