Digital television (DTV) is the transmission of television signals, including the sound channel, using digital encoding, in contrast to the earlier television technology, analog television, in which the video and audio are carried by analog signals. It is an innovative advance that represents the first significant evolution in television technology since color television in the 1950s.

### **Digital television - Wikipedia**

In electronics and telecommunications, modulation is the process of varying one or more properties of a periodic waveform, called the carrier signal, with a modulating signal that typically contains information to be transmitted. Most radio systems in the 20th century used frequency modulation (FM) or amplitude modulation (AM) for radio broadcast. A modulator is a device that performs modulation.

The world of electronics was initially dominated by analogue signalsâ€”that is, signals representing a continuous range of values. In digital circuitry, however, there are only two states: on and off, also referred to as 1 and 0, respectively.
