In classical physics and general chemistry, matter is any substance that has mass and takes up space by having volume. All everyday objects that can be touched are ultimately composed of atoms, which are made up of interacting subatomic particles, and in everyday as well as scientific usage, "matter" generally includes atoms and anything made up of them, and any particles (or combination of ...

Dark matter is a hypothetical form of matter that is thought to account for approximately 85% of the matter in the universe, and about a quarter of its total energy density. The majority of dark matter is thought to be non-baryonic in nature, possibly being composed of some as-yet undiscovered subatomic particles. Its presence is implied in a variety of astrophysical observations, including ...

Introduction. Molecular motors use chemical energy and transform it into work, orchestrating myriad processes inside a cell. They are examples of active matter, i.e. entities that stay out of thermodynamic equilibrium by consuming energy in the environment (or internally stored) in order to move []. There is a growing interest in creating synthetic analogues, not only to reveal and understand ...
