Lets say all interlocks are healthy, so PLC sends the permissive signal to motor feeder.. Now start push button is pressed. First PLC checks the Local/Remote status, if it is in Remote then proceeds further. Again it checks for any active trips/interlocks.If there is no interlock or all working normal, then PLC sends a start command to substation where motor feeder is installed.

In computer programming, a string is traditionally a sequence of characters, either as a literal constant or as some kind of variable. The latter may allow its elements to be mutated and the length changed, or it may be fixed (after creation). A string is generally considered a data type and is often implemented as an array data structure of bytes (or words) that stores a sequence of elements ...
